Company Description

Nine Energy Service, Inc. is a North American onshore completion and production services company focused on unconventional oil and gas development. The Company provides a range of downhole tools, completion technologies, and related services used to prepare horizontal, multistage wells for production across major U.S. and Canadian basins. Nine's core offerings include cementing, wireline, completion tools, and coiled tubing solutions designed to improve wellsite efficiency, execution, and reliability. Through its service footprint and technology portfolio, the Company is positioned to support customers across the completion cycle in shale and other unconventional resource plays.

NINE agreed to buy American Cementing for $36.2M, or 3.0x trailing adjusted EBITDA. NINE will pay $7.0M in cash and issue 3.93M shares, about 22% of post-close shares. The deal roughly doubles NINE's active Cementing fleet and expands its reach into the Rockies, Bakken and Northeast. With 3Q Cementing utilization at 106%, the added units give NINE room to take on more work, while greater purchasing scale could lower material costs. Management estimates $2M to $5M in 2027 synergies and illustrates pro forma net leverage of 2.3x versus 2.9x standalone. Closing is expected in 1Q27, subject to stockholder approval and customary conditions.

Quarterly Results: Revenue of $142.0M came in near the top of management's $133M to $143M range and was essentially flat q/q. Cementing rose 11% to $61.1M, adding roughly $5.8M and offsetting the decline in total Completion Tools revenue, which management attributed primarily to international order timing. The mix shift helped lift adjusted gross margin 43 bps and adjusted gross profit to $20.6M from $19.9M. Higher G&A more than offset the gross-profit gain before EBITDA adjustments. Adjusted EBITDA fell 3.7% to $8.3M, in line with guidance.

CFFO rose to $4.7M from a $2.3M outflow, largely on working-capital timing. Payables and accruals contributed $5.2M after using $7.4M in 2Q, cushioning an $8.3M inventory build. Liquidity was $46.0M, including $29.9M of revolver availability. FY26 CapEx remains $20M to $30M, with spending now expected near the midpoint versus the middle-to-lower end previously. With $13.2M of reported CapEx through 3Q, the midpoint implies $11.8M in 4Q. Payment timing shapes how much expected profitability improvement reaches free cash flow.

End Markets / Activity: Management considers the pace at 106% Cementing utilization sustainable and wants better pricing before adding capacity. That puts the focus on recovering more of NINE's costs through pricing on existing work. NINE has engaged external resources in 3Q to review its centralized procurement process and improve purchasing discipline with an eye on stronger profitability. The Company's focus on profitability extended to its exiting of lower-return Wireline operations in West Texas and North Dakota. This will allow NINE to sharpen the focus on the Haynesville Basin.

In Completion Tools, routine engineering and new-product qualification compete for testing time. The new facility, expected online in 1H27, is designed to triple capacity to six simultaneous tests. The additional capacity should allow NINE to test existing products and qualify new tools at the same time, potentially accelerating development for higher-pressure international wells. NINE is also field-testing new completion tools designed to shorten customer drill-out times and reduce its own product costs, supporting potential Permian share gains.

Guidance: Management expects $137M to $147M in 4Q26 revenue and modestly higher profitability as higher-margin Cementing and international Completion Tools are expected to account for more of the mix. International order timing limits how far we would extrapolate the margin benefit. The remaining large-diameter Coiled Tubing unit offers a separate source of earnings improvement through more billable capacity. Management took a conservative view of the unit's 4Q contribution. If the unit returns in December and is redeployed on schedule, we expect the larger contributions to be in 1Q27.

Valuation: We use a DCF and EV/EBITDA analysis to guide our valuation. Our DCF analysis produces a valuation range of $10.64 to $16.73 with a mid-point of $13.20. Our EV/EBITDA framework produces a range of $12.34 to $15.56 with a mid-point of $13.95. Using a simple average this arrives at a valuation range of $11.49 to $16.14 with a price target of $13.57.

VALUATION

We are using a DCF Model to guide our valuation of NINE as we expect the Company to be a strong cash flow generator in the out year, supported by its asset light model. Currently our model assumes strong growth over the near term as the Company will be marked against softer year over year comps, growth from the recent acquisition, and the commodity outlook looks robust with FY27 crude futures above $70.00 per barrel. With the exception of the current year, we believe the Company will maintain its asset light model, keeping CapEx under control. Our model normalized growth rates in the 3% range and operating margins in the low-to-mid single digits, both of which we believe are in-line with peer estimates. We apply a discount rate above the standard 10% to account for both the Company size as well as the overhang coming out of bankruptcy.

Sensitivity Analysis:

Discount rate	Terminal Growth Rates 1.0%	1.5%	2.0%	2.5%	3.0%
10.00%	$18.32	$19.07	$19.90	$20.85	$21.94
11.25%	$15.01	$15.52	$16.09	$16.73	$17.44
12.50%	$12.43	$12.80	$13.20	$13.64	$14.13
13.75%	$10.37	$10.64	$10.93	$11.24	$11.59
15.00%	$8.69	$8.89	$9.10	$9.34	$9.59

Our DCF analysis relies on a range of discount rates between 11.25% and 13.75% with a midpoint of 12.50%. This arrives at a valuation range of $10.64 to $16.73 with a mid-point of $13.20.

We are also using an EV/EBITDA framework to inform our NINE valuation. Currently NINE is trading at a 2027E EV/EBITDA of 3.6x compared to comps at an average of 6.0x. We are using our 2027E expected EBITDA, and an EV/EBITDA range of 5.5x to 6.5x with a midpoint of 6.0x which moves NINE closer to comp companies, while maintaining a reasonable discount to account for NINE's size and current restructuring activity. This arrives at a valuation range of $12.34 to $15.56 with a mid-point of $13.95.

EV/EBITDA			
2027E	**5.50x**	**6.00x**	**6.50x**
Adj EBITDA	57.5	57.5	57.5
TEV	316.2	345.0	373.7
Cash	16.1	16.1	16.1
Debt	111.6	111.6	111.6
Mrkt Cap	220.7	249.4	278.1
S/O	17.9	17.9	17.9
Price	**$ 12.34**	**$ 13.95**	**$ 15.56**

When we combine these two valuation methods using a simple average it arrives at a 2027E valuation range of $11.49 to $16.14 with a price target at the mid-point of $13.57.

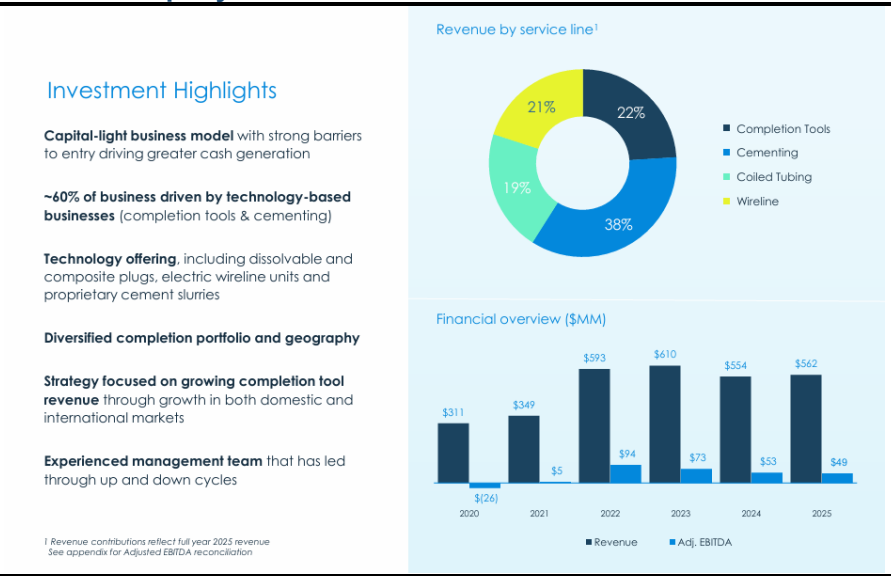

Company History

Nine Energy Service (NYSE American: NINE) was formed in February 2013 through the combination of three oilfield service companies owned by SCF Partners, creating a completion-focused platform built around the U.S. unconventional market. The Company went public in January 2018 under ticker NINE, expanded as a North American completion-services provider focused on cementing, completion tools, wireline, and coiled tubing, and then restructured through a prepackaged Chapter 11 in early 2026 after a difficult 2025 marked by weaker activity, pricing pressure, and liquidity strain. Importantly, the current public equity reflects the reorganized company, not the pre-bankruptcy common, which was canceled in the restructuring.

Company Overview

Nine is an asset-light, North American onshore completion-services company. It does not drill wells or produce hydrocarbons. Instead, it operates in the phase of the well lifecycle that sits after drilling and before production, supplying the tools, equipment, and field execution needed to cement the well, isolate stages, execute plug-and-perf completions, and prepare the wellbore for flowback and production.

Exhibit 2: Company Overview and Historical Financial Results

Source: Company Reports

That positioning is important because Nine is levered less to drilling economics in isolation and more to completion activity and service intensity. The Company's exposure is concentrated in the technically demanding parts of modern unconventional development, where longer laterals, higher stage counts, and more complex designs increase the amount of work required per well. Management has consistently framed the business around these trends, noting that extended-reach horizontals, rising stage counts, and denser pad development can support operating leverage by allowing more stages and jobs to be completed with the same crew and equipment base. Greater well complexity and the increased potential for costly mistakes or well integrity issues also elevate the importance of execution and reputation, which can benefit established providers with a track record of reliable performance.

The model is also more selective than it may initially appear. While Nine reports as a single Completions Solutions segment, the underlying portfolio is best understood through four service lines: cementing, completion tools, wireline, and coiled tubing. Those businesses are not equal in quality. In our view, cementing is the scale anchor and earliest-well entry point; completion tools is the most differentiated and scalable bucket; wireline is the cleanest direct lever on frac-stage execution; and coiled tubing broadens lifecycle exposure into cleanout and intervention but carries the greatest pure utilization sensitivity.

Financial Improvements

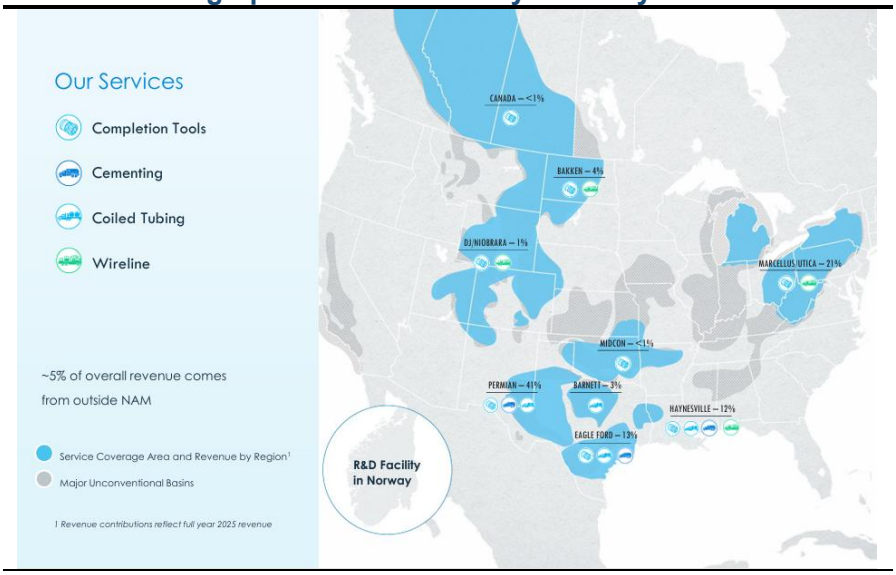

The business entered 2026 as a still-scaled North American completion-services platform, but one whose late-2025 equity story had become dominated by liquidity pressure, weaker activity, and an unsustainable capital structure. That changed with the prepackaged Chapter 11 filing on February 1, 2026. Nine emerged on March 5, 2026, after canceling the prior common stock and issuing new common stock to holders of its former senior secured notes. The Company emerged with a $135M Exit ABL commitment and adopted fresh-start accounting, which limits comparability between predecessor and successor financial results.

That distinction matters because the current debate is no longer whether Nine survives its balance sheet; it is whether a cleaner capital structure can unlock the earnings power of a still-relevant completion franchise. In our view, that is the right lens for the reorganized equity.

Operating Basins

Nine operates across the key North American unconventional basins, with revenue led by the Permian, Marcellus/Utica, and Eagle Ford as the three revenue leaders while Midcon and Canada each represent less than 1% of revenue. Less than 10% of total revenue comes from outside North America, and the Company's international exposure is primarily tied to completion tools rather than a broad international field-services footprint.

Exhibit 3: Geographic and Commodity Diversity

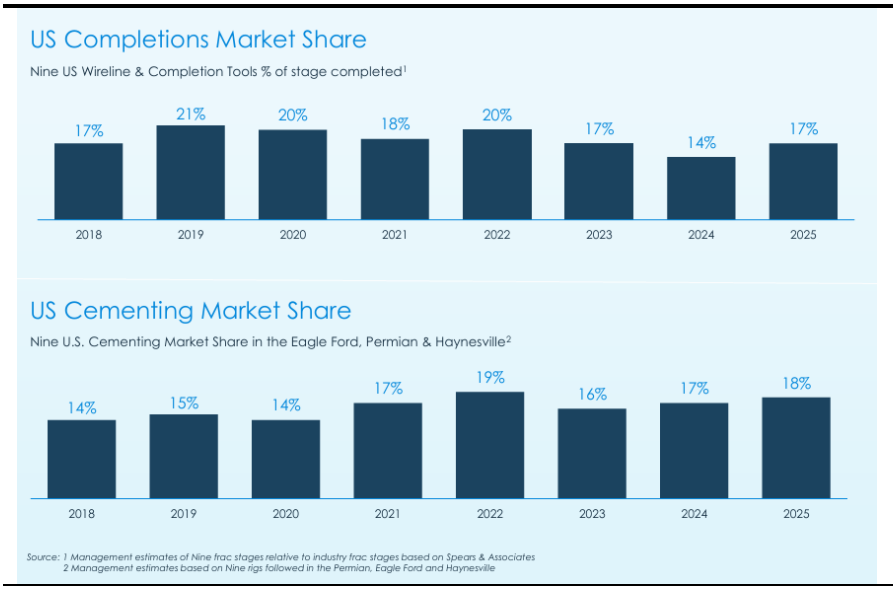

Source: Company Reports

That footprint matters because it gives Nine real exposure to both oil- and gas-weighted completion markets. The Permian, Bakken, and DJ/Niobrara are primarily oil basins, albeit with associated gas. The Marcellus/Utica, Haynesville, and Barnett are predominantly gas. The Eagle Ford, Midcon, and Canada provide mixed exposure. In practical terms, that means Nine is levered to both the dominant oil basin in North America and two of the most important gas basins, which helps diversify the activity mix even if the Company remains meaningfully tied to North American onshore completions overall.

The earnings implications are straightforward. Stronger gas-basin activity can support tools and wireline demand in the Northeast and Haynesville, while the Permian remains the key swing factor for broader North American oilfield services activity and pricing. In practice, this mix gives Nine exposure to both supportive gas-driven completions activity and the more cyclical oil-basin dynamics that tend to shape industry pricing and utilization.

Exhibit 4: Market Share Overview

Source: Company Reports

Business / Services Lines

Nine's portfolio spans much of the unconventional completion workflow, from securing casing and preparing the well for stimulation, to stage-by-stage execution and ultimately wellbore cleanout. That breadth matters because it gives the Company exposure across multiple steps in the completion chain rather than tying the story to a single product or isolated service line. In practical terms, this means Nine participates not only in overall well count, but in the amount of work, equipment, and execution required to move a well from drilled to producing. That distinction has become increasingly important in modern shale development, where longer laterals, higher stage counts, and more complex completion designs have made completion intensity and work per well more meaningful demand drivers than simple activity growth alone. As a result, the value of the portfolio lies not just in its range, but in its ability to provide exposure to the technical complexity, service content, and operational cadence embedded in today's unconventional wells.

Exhibit 5: Service Lines

Source: Company Reports

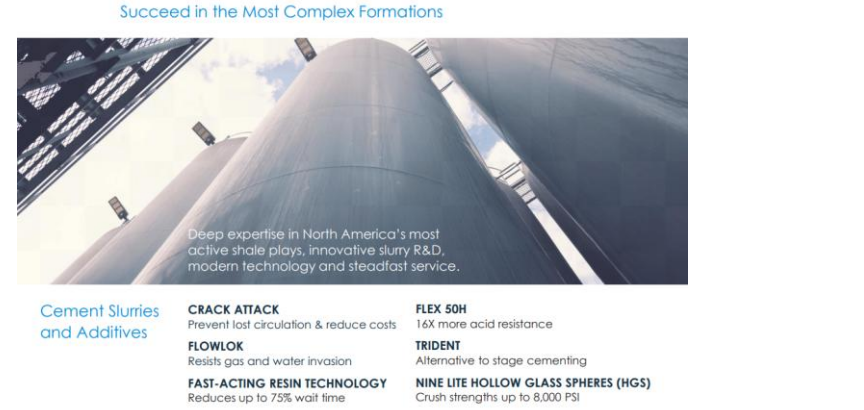

Cementing

Cementing is typically Nine's earliest point of engagement and remains the Company's largest service line. In practical terms, it is the business that most directly follows the drill, as it comes into play once casing has been run and the well is being prepared for the next stages of completion.

Operationally, cementing is mission-critical. After casing is run, a cement slurry is pumped into the annulus to secure the casing, isolate zones, and protect long-term well integrity. That process is more technically sensitive than it may appear, because the slurry has to be engineered with the right balance of properties, including viscosity, stability, thickening time, compressive strength, and fluid-loss control, in order to perform properly under specific downhole conditions. If the slurry is not designed correctly, operators can face poor zonal isolation, circulation issues, remediation risk, and ultimately impaired well performance.

In our view, that is one reason cementing is one of the more defensible parts of the portfolio. It is not simply a commodity service; it is an engineering-heavy offering where job design, execution, and service quality matter materially. Because the consequences of poor performance can be costly and long-lived, reputation becomes especially important, particularly in harder wells where customers place a premium on reliability and consistency.

Exhibit 6: Cementing and Drilling Solutions

Source: Company Reports

Completion Tools

Completion Tools is the most differentiated part of the portfolio and, in our view, is one of the clearest expressions of Nine's technology-led positioning. The business is anchored by composite, hybrid, and dissolvable frac plugs, along with broader completion hardware including liner hangers, frac sleeves, fracture isolation packers, stage-one prep tools, and related accessories.

Operationally, tools sit at the center of the multistage stimulation process. In unconventional wells, they are used to isolate stages, direct treatment to the intended interval, and support the stage-by-stage execution that defines modern plug-and-perf completions. The service line helps determine how efficiently and reliably operators complete each stage.

Exhibit 7: Dissolvable Plug

Source: Company Reports

Strategically, Completion Tools remains the most scalable business in the portfolio. Compared with the more labor- and utilization-sensitive service lines, Completion Tools offers greater differentiation and broader geographic scalability, including into international markets, without requiring a similarly broad field-services footprint. In our view, Cementing provides scale, while Completion Tools offers the clearest path to technology-driven growth and a better revenue mix. At the same time, the service line still depends on product relevance and ongoing adaptation as customer well designs evolve, which makes engineering quality and innovation central to sustaining its competitive position.

Wireline

Wireline is the execution layer of the plug-and-perf process and the clearest direct lever on frac-stage activity. Operationally, wireline sits at the heart of stage execution, as it is used to convey perforating guns and related tools into the wellbore once the well has been cased and cemented.

That role makes wireline especially important in modern unconventional completions. In practical terms, it enables the stage-by-stage perforating process that defines plug-and-perf activity, meaning demand is closely tied to the number of stages being completed. Because of that, wireline provides one of the most direct ways to participate in completion activity and frac-stage intensity across key basins.

In our view, this makes wireline an important part of the portfolio. At the same time, the segment is more closely tied to job flow, crew utilization, and local pricing conditions than some of Nine's other service lines. As a result, performance can respond relatively quickly to changes in regional activity and customer cadence, making service quality, operational efficiency, and consistency key drivers of results.

Exhibit 8: Electric Wireline

Source: Company Reports

Coiled Tubing

Coiled Tubing rounds out the portfolio by extending Nine's exposure into the later-stage cleanout and intervention phase of the well lifecycle. Coiled tubing becomes most relevant after the frac has been completed and the well is moving closer to production.

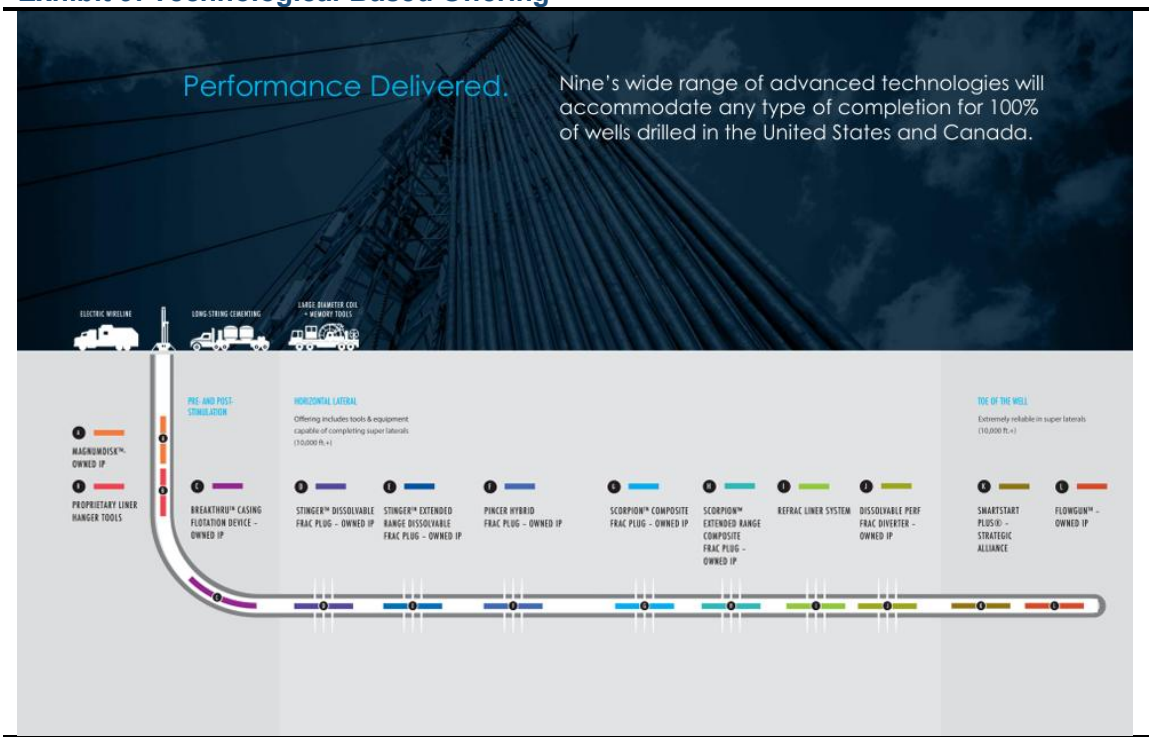

In the unconventional context, the most important use case is typically plug millout and wellbore cleanout after stimulation, though the service line also supports broader intervention activity. Coiled tubing helps prepare the well for flowback and production, extending Nine's role into the later stages of completion.

In our view, this makes coiled tubing an important part of the portfolio because it broadens Nine's role across the full completion workflow. At the same time, the segment is more closely tied to activity levels, utilization, and day-rate conditions, making operational efficiency and customer demand important drivers of performance. Even so, coil adds useful lifecycle breadth and helps position Nine as a more complete completion-oriented service provider.

Segments Takeaway

Taken together, the portfolio is broader than a single-product or single-service story. Cementing is the scale anchor and one of the more defensible parts of the business, while Completion Tools is the most differentiated and scalable service line and the clearest source of technology-driven and international upside. Wireline and Coiled Tubing give Nine exposure to well count, completion complexity, stage density, and work across the completion cycle in North America.

Exhibit 9: Technological-Based Offering

Source: Company Reports

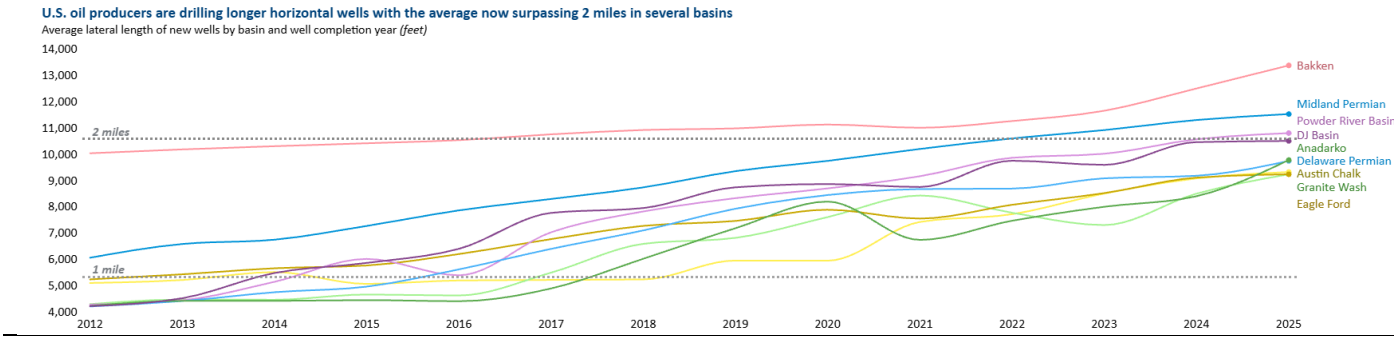

Key Catalysts

In our view, Nine's upside is driven by higher completion intensity, a cleaner post-restructuring balance sheet, international Completion Tools growth, improving gas-basin activity and mix, and Cementing share gains and pricing. The remaining large-diameter Coiled Tubing unit provides a separate near-term catalyst. A December return is possible, and we see 1Q27 as the better window for an earnings contribution if the unit is redeployed on schedule.

Higher Completion Intensity

The clearest structural driver remains higher work per well. Longer laterals, denser pad development, and rising stage counts all increase demand for cementing design, stage-isolation tools, wireline activity, and post-frac intervention. For Nine, that means service content can grow even if well count remains relatively disciplined, which is an important distinction in the current market.

Exhibit 10: Longer Laterals Drilled Trends

Source: American Petroleum Institute

We also think it is important to consider the mix of work inside the completion cycle, not just the number of wells. As operators continue pushing more complex well designs and look for ways to maximize recovery from existing acreage, the opportunity set can extend beyond initial completions into other leading-edge completion and intervention work, including refrac-related activity where applicable. We would not frame refrac as the core thesis today, but it fits the broader idea that Nine benefits when operators demand more technical completion work per well and across the life of the asset. That dynamic is directionally favorable for a company with exposure spanning cementing, tools, wireline, and coiled tubing.

Cleaner Post-Bankruptcy Setup

The more immediate catalyst is the reset capital structure. By late 2025, the balance sheet had become the dominant issue, overshadowing the operating franchise. Post-emergence, Nine is in a better position to focus on customers, execution, and selective growth rather than on near-term liquidity management, which should improve commercial flexibility if activity stabilizes.

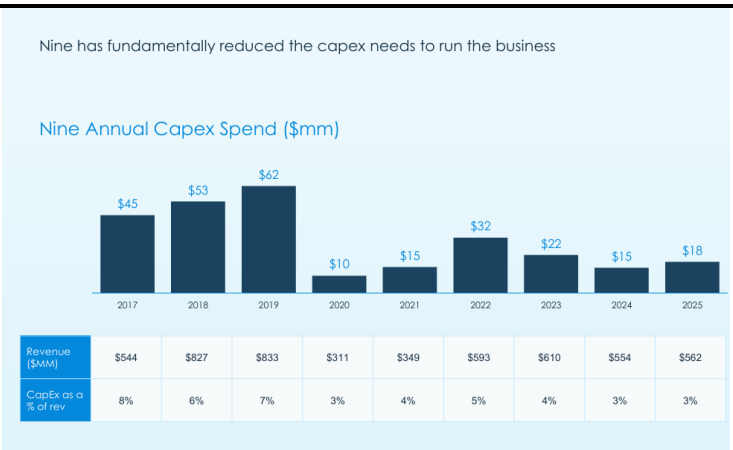

Exhibit 11: Asset-Light Model

Source: Company Reports

That reset is more compelling when paired with the Company's asset-light model. Nine has emphasized that it operates with an asset-, emissions-, and labor-light model, and company materials show that average annual capex fell meaningfully from pre-2020 levels to a much lower run rate in the years that followed. In our view, that matters because the reorganized company does not need a heavy capital spending cycle to participate in improving completion activity or mix. A cleaner balance sheet layered onto a structurally lighter capital model should improve flexibility and potentially allow more of any incremental recovery to flow through to earnings and cash generation.

Exhibit 12: CAPEX Reduction

Source: Company Reports

International Completion Tools Growth

The clearest company-specific growth vector remains international Completion Tools. International order timing weighed on 3Q sales, while a higher contribution from international Tools is part of management's outlook for better 4Q profitability. The new testing facility, expected online in 1H27, should allow product qualification to run alongside routine engineering and expand Nine's ability to qualify tools for higher-pressure international wells.

In our view, this is one of the more attractive growth avenues in the story because tools are more scalable across geographies than field-service-heavy offerings and can expand without requiring a broad international services footprint. That matters not just for growth, but for mix: if international tools becomes a larger share of the business over time, it would further reinforce the idea that the best part of the portfolio is gaining weight inside the overall model.

Gas-Basin Recovery and Better Mix

Gas-basin improvement is better viewed as a mix and utilization catalyst than as a primary structural growth driver. Nine has meaningful exposure to the Marcellus/Utica and Haynesville, and management has been constructive on the medium- and long-term outlook for natural gas and gas-levered regions. Stronger gas-directed completions can support tools and wireline demand and improve regional mix, even if that benefit is not always large enough on its own to offset broader oil-basin weakness.

It is also worth remembering that the Permian is not purely an oil story. While it remains the key swing basin for broader North American oilfield services activity and pricing, it is also a major source of associated gas. As a result, an improving gas backdrop can matter to Nine not only through the Northeast and Haynesville, but also indirectly through activity and economics in the Permian system itself. We would still frame the Permian primarily as the dominant oil-basin driver, but the basin's gas component adds another layer to the Company's commodity mix and reinforces that Nine's exposure is not as one-dimensional as a simple "oil services" label might imply.

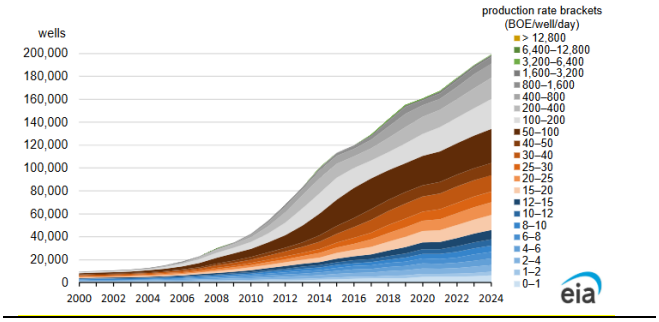

Cementing Share Gains and Pricing

American Cementing would add 35 to 40 active units to Nine's 30 to 35 and increase Cementing from roughly 41% to 57% of trailing revenue on a pro forma basis. We see purchasing scale as the clearest near-term margin opportunity because lower material costs can benefit existing jobs even if pricing stays flat. The larger Cementing mix also makes the combined company's earnings more sensitive to utilization and pricing in that service line.

Market Overview

Nine operates in the North American unconventional completions market, where demand is increasingly driven by both drilling activity and the amount of completion work required per well. Nine participates in baseline well activity through Cementing. More complex completions can also increase demand for stage-isolation tools, Wireline, and post-frac intervention.

Exhibit 13: U.S. Horizontal Wells by Production Rate Bracket

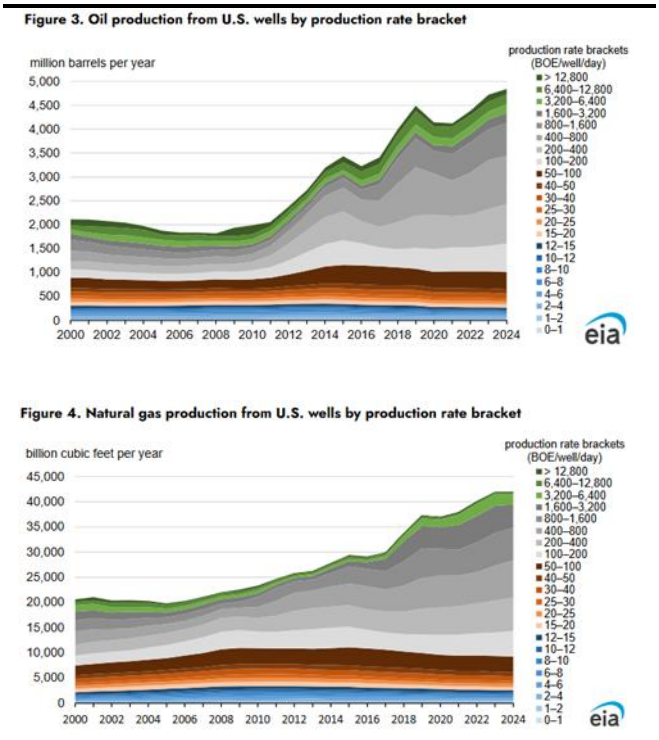

Source: U.S. Energy Information Administration

Over time, the market has shifted toward a development model that embeds more completion work into each well and each location. As wells have become more horizontal, laterals have become longer, and pad development has become denser, the amount of completion activity required per project has increased. For Nine, that is important because the Company is positioned in the part of the workflow where that added complexity shows up most directly. Cementing follows drilling, while Completion Tools, Wireline, and Coiled Tubing can benefit from more technically demanding well designs.

In a disciplined rig environment, longer laterals, denser completions, and higher well productivity can increase service demand per well. Improving gas economics and stronger gas-directed development can support activity in regions such as the Marcellus/Utica and Haynesville, where Nine has meaningful exposure through tools and wireline.

Exhibit 14: Production from U.S. Wells by Production Rate Bracket

Source: U.S. Energy Information Administration

The U.S. rig count rose to 599 at the end of 3Q26 from 573 at the end of 2Q26, while Haynesville was broadly flat at 56 versus 55. The domestic pickup supports the near-term activity backdrop, while stronger gas-directed completions remain a prospective catalyst for Nine.

From a competitive standpoint, the market remains fragmented, but technical execution, engineering complexity, and differentiated products matter most in the parts of the completion market where Nine competes. Company materials indicate meaningful U.S. completions market share in wireline and completion tools, measured as a share of stages completed, as well as meaningful cementing share in the Eagle Ford, Permian, and Haynesville. Those are relevant positions in a large and competitive market and support the view that the Company already operates at real scale in the service lines most important to its thesis.

Nine's market is best framed as a large, cyclical, and increasingly intensity-driven unconventional completions market. With horizontal wells dominating unconventional output and pad development becoming denser, basin exposure and technical execution help determine how much of the work per well Nine can capture.

Risks

As with any investment, there are certain risks associated with Nine Energy Service's operations, as well as with the broader commodity and activity environment that drives the North American oilfield services market.

Commodity and Customer Spending Sensitivity - Nine's business is closely tied to customer capital spending and well completions in the onshore oil and gas market. Lower oil or natural gas prices can quickly reduce completion activity, delay work, and pressure demand across the Company's service lines.

Spot Market and Pricing Pressure - A meaningful portion of Nine's work is performed in the spot market, where pricing adjusts quickly to activity levels and competitive intensity. In weaker markets, customers can rebid work aggressively, compress margins, and create white space across fleets and crews.

Permian Concentration - The Company's revenue base is concentrated in a handful of major unconventional basins, most notably the Permian. While that exposure provides leverage to one of North America's most important completion markets, it also increases sensitivity to oil-driven slowdowns and localized pricing pressure.

Post-Restructuring Execution - Although the balance sheet has been reset through Chapter 11, the Company still needs to demonstrate that the reorganized platform can stabilize customer relationships, retain talent, and convert a cleaner capital structure into improved earnings power.

Technology and Execution Risk - Completion tools and cementing are among the more differentiated parts of the portfolio, but both depend on product relevance, engineering quality, and reliable field execution. Changes in customer completion design, market share losses, or operational underperformance could pressure results.

Acquisition Integration - The expected procurement savings depend on Nine's ability to consolidate purchasing and standardize materials while retaining customers and field crews. Delays could defer the expected earnings benefit while the cash consideration and transaction costs increase net debt at closing.

IMPORTANT DISCLOSURES AND DISCLAIMER

(a) The research analyst and/or a member of the analyst's household do not have a financial interest in the debt or equity securities of the subject company.
(b) The research analyst responsible for the preparation of this report has not received compensation that is based upon Stonegate Capital Partners' ("SCP") equity affiliate Stonegate Capital Markets ("SCM"), a FINRA member, investment banking revenues.
(c) SCP or any affiliate has not managed or co-managed a public offering of securities for the subject company in the last twelve months, received investment banking compensation from the subject company in the last 12 months, nor expects to receive or intends to seek compensation for investment banking services from the subject company in the next 12 months.
(d) SCP has a contractual agreement with the subject company to provide research services, investor relations support, and investor outreach. SCP receives a monthly retainer for these non-investment banking services.
(e) SCP or its affiliates do not beneficially own 1% or more of any class of common equity securities of the subject company.
(f) Neither SCP nor its equity affiliate SCM, a FINRA member, make a market in the subject company.
(g) The research analyst has not received any compensation from the subject company in the previous 12 months.
(h) SCP, the research analyst, or associated person of SCP with the ability to influence the content of the research report does not know or have reason to know of any material conflicts of interest at the time of publication or distribution of the research report.
(i) No employee of SCP has a position as an officer or director of the subject company.

Ratings - SCP does not provide ratings for the covered companies.
Distribution of Ratings - SCP does not provide ratings for covered companies.
Price Chart - SCP does not have, nor has previously had, a rating for its covered companies, however, SCP does provide a price target on the covered company. Please see the following page for the historical price chart. This chart shows the covered company's stock price since SCP has been covering the covered company as well as the corresponding SCP price target.
Price Targets - SCP may provide price targets for its covered companies. For a complete understanding of valuation methodologies and risks associated please read this report in its entirety. In instances where SCP does not provide a price target SCP will still provide a valuation analysis.
